Data and Analytics Leaders: Rewire Your Culture for an AI-Augmented Future

Published: 27 February 2020   ID: G00465952

Analyst(s): Andrew White

Data and analytics leaders are expected to deliver sustainable, repeatable business value from increased investments in data, analytics and artificial intelligence. To meet these expectations, D&A leaders need to rewire their organizational culture for an AI-infused future — starting now!

Opportunities and Challenges

- How should you prioritize data and analytics (D&A) investment size, mix and sequence in order to drive the greatest business impact?
- How do you get started with a data literacy campaign, which is a new challenge for senior D&A leaders committed to creating a data-driven culture across the workforce?
- How can you leverage the best of “centralize all” and “everything at the edge” organizational models with hybrid models exploiting new data sources, new techniques and new ecosystems?
- How can you make the work of D&A governance business-driven and relevant, and how do you “make it stick”?
- How do you extract sustainable and repetitive business value from growing investment in artificial intelligence (AI) capabilities?

What You Need to Know

- It is essential to embed the work of D&A in a business context and you should stop talking about data, analytics, AI and technology, which shifts the focus from outcomes to technology.
- You will need to describe your D&A value proposition upfront and sell it directly to all stakeholders.
- Championing data literacy and crafting a clear case for change should come before pursuing implementations.
- Adopting a portfolio approach will help to prioritize your various D&A investments.
Working with your peer business leaders will make sure you put the most important work of D&A in the most appropriate place in the organization.

Data and analytics governance should start with a focus on the least amount of data with the biggest business impact.

**Insight from the Analyst**

**Rewire Your Organizations’ Culture for an AI-Augmented Future**

Andrew White — Gartner Distinguished VP Analyst

Simply put, we have more data than we know what to do with; we have limited budgets, time and resources; we struggle to find (and keep) the right talent; and AI and machine learning are being applied to drive business value. Technology vendors offer a wonderment of new solutions to problems we might not even know about. All the while boards of directors, CEOs and CIOs want more value and they want it yesterday. Does it ever change?

Despite the conditions we face, 2020 is a pivotal year with data and analytics. D&A and AI may have already peaked in terms of topical hype. As such, it is time to get down to business and start to take the actions that will put in place sustainable, repeatable behaviors that deliver on the promises made.

Culture is seen as the greatest challenge to D&A success as far as CDOs and other senior data and analytics leaders are concerned.

Despite the promise of AI and ML, the greatest challenge of all is not data, or process, or technology — it is culture. Such technologies have promised automation galore and insight discovery at the flip of a switch. But culture continues to impede our ability to achieve the promise of a data-driven enterprise with automation galore and insight discovery at our fingertips. But business value is not yet rolling in. D&A leaders need to put critical touchstones in place today to ensure the right decisions are taken, in the right way, at the right time, and for the right outcome (see the Evidence section). This is the focus of this research. We highlight the critical touchstones you need to set up now in order to help rewire your culture so that you cannot just live in our collective AI-augmented future, but thrive in it too.

AI may be everywhere soon, but some preparation is needed to get value from it. That starts now!

Kind regards,

Andrew White
Executive Overview

Definition

When you try to make a decision, whatever your role in an organization, data is part of that effort. If you compare one piece of data to another, you are analyzing it. Every effort to improve that decision will necessarily include more data and more analysis. In digital business, every business moment is an opportunity to transform the relationship with and satisfaction of a citizen or customer — through a change in decision. That might require new insight, at the right time, in the right form, and as automated as possible. In other words, D&A drives every decision — strategic, operational or tactical — across the enterprise.

Figure 1. Data and Analytics Strategies Driving the Future
Leadership and Culture: Build the Resilient Organization

D&A is the linchpin of embedding insight and intelligence into every decision, every opportunity and every outcome.

That’s the good news. Now the bad news — you must deliver value, now, all while the organization resists your efforts to create change. The reality is that being data-driven is misunderstood. It does not mean that every decision is automated. It means that insight is used to augment humans making decisions smarter, faster and more effective.

In a number of enterprises, data and analytics has moved outside of the IT department and into the functional business units. Hybrid roles — which marry business domain knowledge to D&A capabilities — will continue to predominate. CDOs and other leaders have an increasingly complex role. For instance, our research suggests that data literacy will be the single biggest determinant of a successful deployment of data, analytics and AI. As a result, the modern organization is a combination of different parts. It is a service center, a capability enabler, a competency developer, a community builder and a problem solver.

But the pressure is on. You have been spending on BI platforms and self-service analytics for some years. You tried that MDM program. More recently, your organization adopted cloud, and now you hear about multicloud. You have virtualized, integrated, harmonized, cataloged, profiled, warehoused, liked, and analyzed for ages. But are these investments always as successful as you would like? Do your business peers acknowledge their business value? Has success been assured? All too rarely.

What is needed is a new, bold, fresh way to think about, and do, D&A. We need to rethink how decisions are made, recognizing that AI will not fix everything. We need to reorganize where the work of D&A takes place so that the capabilities empower the right work, for the most value, for the most important business outcomes. We need to rewire our culture. We need to put in place the foundations — some you know about already — needed to assure sustainable, repeatable, business value and impact creation.

CEOs in all industries are turning to CDOs (and other data and analytics leaders) to build organizations of the future to meet and exceed business objectives.²

D&A leaders must lead from the front and build an organization that defines, delivers, and demonstrates value creation from data and analytics investments. D&A leaders need to drive the vision and strategy for their organizations, representing and fermenting what the business needs in terms of data, analytics and AI. Insight is provided on topics that are high on the agenda for
forward-thinking data and analytics leaders: skills development, closing talent gaps, building the right teams, formalizing the right roles, data literacy, diversity and ethics.

Business Outcomes and Strategy: Realize the Value

The majority of chief data officers (CDOs) are not formally measuring the business value of their information or data assets. Those that do achieve better organizational performance than their peers.¹
Data and analytics remain very popular in terms of investment priorities, yet success in measuring and reporting the value from investments remains tangible at best. Our research provides insights into how to build a successful D&A strategy that is directly linked to the key business outcomes of growth, customer experience, monetization of D&A, risk mitigation and innovation.

Trust and Governance: The Evolving Challenge

By 2023, 30% of organizations will exceed data and analytics ROI by governing the least amount of data that matters most to their strategic goals.²

Every outcome, every decision and every action relies on trusted data. When data is untrusted, mayhem may ensue. But today’s modern D&A governance effort is very different from what you are used to. Gone are big projects and end-to-end data focus. Gone are efforts to document all of your data before you start. What’s “in” is adaptive efforts that seek to govern the least amount of data for the biggest business impact.

Through 2021, 75% of AI projects will remain at the prototype level as AI experts and organizational functions cannot engage in a productive dialogue.

There is a minefield of complexity across advanced analytics, data science, AI and machine learning. All might add value to your organization, if you know where and how they should be applied. You need a plan, a strategy, an idea to articulate what outcome you are seeking. With those in place you can demystify AI and start to put solutions in place.

Data and Analytics Everywhere: Drive Pervasive Outcomes

Adoption of data, analytics and AI programs across the organization is varied and often meets with different challenges, as well as targeted at different value propositions. Some efforts are centralized and operated by IT or a shared service and focused on productivity; some are distributed in the business units and focused on agility and innovation. You need both, in fact, in a hybrid form and you need to embed data literacy into the organization.

To drive organizational efficiencies and grow the business, data and analytics must be at the heart of the organization. It must beat at the same rhythm as finance, sales, marketing, supply chain and all other core business functions.

Emerging Technologies: Disruption Is a Given

Harnessing innovative technologies to change the business and how we serve customers is the only choice for forward-looking leaders who want to see their organizations become disruptors. Standing still is not an option.

The compressed speed at which disruption is occurring requires data and analytics leaders to have formal mechanisms to identify technology trends and prioritize those with the biggest potential impact on their competitive advantage.

They should be added to your strategic planning, or if part of current plans, looked at in a fresh way based on the extent to which the trends enable your top business priorities.

This research reveals the more visionary and pioneering trends and aspects of D&A. We look at the growing convergence of augmented analytics (or augmented intelligence), which suggests the most advantageous approach is combining human intelligence with machine or artificial intelligence. This research is designed to deliver innovative approaches that will change your perspective by offering insights on the future of D&A in your organization.

Conferences 2020

Join us at one of our Gartner Data & Analytics Summits in 2020, where leaders can gain the skills needed to rewire their cultures for an AI-augmented future.

Leading organizations in every industry are wielding data and analytics as competitive weapons, operational accelerants and innovation catalysts.

New business models and sweeping technology change, including AI, are driving the need for a data-and-analytics-centric culture. Trust and ethics must be established and supported. Data literacy is an imperative. New behaviors and skills will be required. Creative thinking must be cultivated as a fundamental competency. Leaders must evolve their organizational culture by design to support and foster the creativity necessary to survive and thrive in these times of change.

Evidence

1 Gartner’s Fourth Annual CDO Survey (see “Survey Analysis: Gartner’s Fourth Annual CDO Survey — Key Capabilities That Enable Business Success”)

2 Gartner’s 2020 Board of Directors Survey (see “Toolkit: Presentation for Key Findings From the 2020 Board of Directors Survey” [downloadable PowerPoint deck, Page 11])

This research is partly based on Gartner’s 2019 Business Value of Data and Analytics Investments study, which was designed to understand sequencing of implementation, spending and ROI on D&A initiatives across the enterprise. The primary research was conducted online between 7 August and 30 September 2019 among 255 respondents in North America and Western Europe.

Companies were screened for implementation of minimum three D&A initiatives over the past two years.

Respondents were required to participate in the approval and tracking, reporting or measuring of the value of at least three D&A initiatives.
The study was developed collaboratively by Gartner analysts and the Primary Research Team.

Disclaimer: Results do not represent “global” findings or the market as a whole, but reflect sentiment of the respondents and companies surveyed.

**Touchstone:** A fundamental or quintessential part or feature.
